

# **Sound, sense, and music mediation: A historical/philosophical perspective**

Marc Leman  
Frederic Styns

IPEM, Dept. of Musicology,  
Ghent University, Belgium

- Sense to sound, sound to sense

**sense** → associated with musical signification practice

**sound** → associated with physical energy or matter

**music mediation** → intermediary processes that account for the transition of musical sound into sense, or sense into sound

- Mind?, Brain?, Body?
- Technology (as extension)
- This overview:
  - FIRST PART: Historical/Philosophical overview
  - SECOND PART: Own research + perspective

# Stating the problem

- Music can have a powerful effect on human beings. A better understanding of this effect is necessary for two reasons:
  - the development of **technologies for music mediation**
  - the enhancement of possible **beneficial effects**
- Technologies for **music mediation** aim at bridging the gap between sound and sense.
  - Humans think and act in terms of goals, values, interpretation
  - The physical approach considers music from the point of view of physical energy and signal processing.

# Ancient Greek philosophy:

- Pythagoras:  
Focus on acoustics, the nature of tone relationships
- Aristoxenos:  
Music theory and musical practice

# Ancient Greek philosophy:

- Aristotle: music is imitation of “men in action” – music moves our soul in a similar way – basis for understanding emotions
- Plato: music exerts power on people

# Greeks → Descartes

- René Descartes (Musicae Compendium, 1618: good summary of state-of-the-art of ancient greek philosophy + germs of new ideas (mainly on resonance))

Basic explorations of:

- acoustics
- theory of musical practice
- theory of imitation

# Medieval up to Modern times:

- Acoustics and music  
(Mersenne, 1636; Huygens, 1673;  
d'Alembert, 1743; Euler, 1748 –  
"Gradus suavitatis") - numerical  
methods

- Recipes of musical practice  
(Zarlino, 1558 ;Rameau,1722;  
Mattheson 1739 – Der  
Vollkommene Kapelmeister -  
Affektenlehre)

Scientific foundations of:

- Musical Acoustics and
- Music Theory

# 19th - beginning 20th Century:

- Psychophysics (psychoacoustics) (*On the sensations of tone* - v.Helmholtz, 1863)

- Acoustics (*The theory of sound* - Rayleigh, 1877)

- Experimental Psychology (Wundt, 1893)

Theory + experiment  
→ human brain connects sound and sense

# Gestalt theory: 1920/30ies

- Stumpf (1883/90), Brentano (1924), Wertheimer, Köhler

- Focus on the perception of structure:
  - Gestalt laws: proximity, common fate...
  - Good forms: prägnanz
- Many scientists moved to USA → cognitive science

# The cognitive approach

- Rationalism/empirism (18th Century)...
- Systematic musicology, Ethnomusicology (Stumpf, 1890; Kurth, 1917; v. Hornbostel, Sachs, 1914 )
- Gestalt theory (Wertheimer, 1924; Köhler, 1929)
- Cognitive science (1960/70ies)...

➔ human brain (mental processing) connects sound and sense

- Moles (1952, 1958), Winckel (1960)
- Entropy, channel capacity (Wiener, Shannon)
- Music conceived in terms of structural parameters
- Link with Berlyne's (1971) work on aesthetics: showing the relationship between arousal (→ appreciation) and structural features (→ novelty) = extending the Gestalt approach to aesthetics

- P. Schaeffer (1966):
  - Role of subject – focus on structural properties (Gestalt-based)
  - Relationship between sound and sense is mediated by technology

- theory
- experimentation
- technology

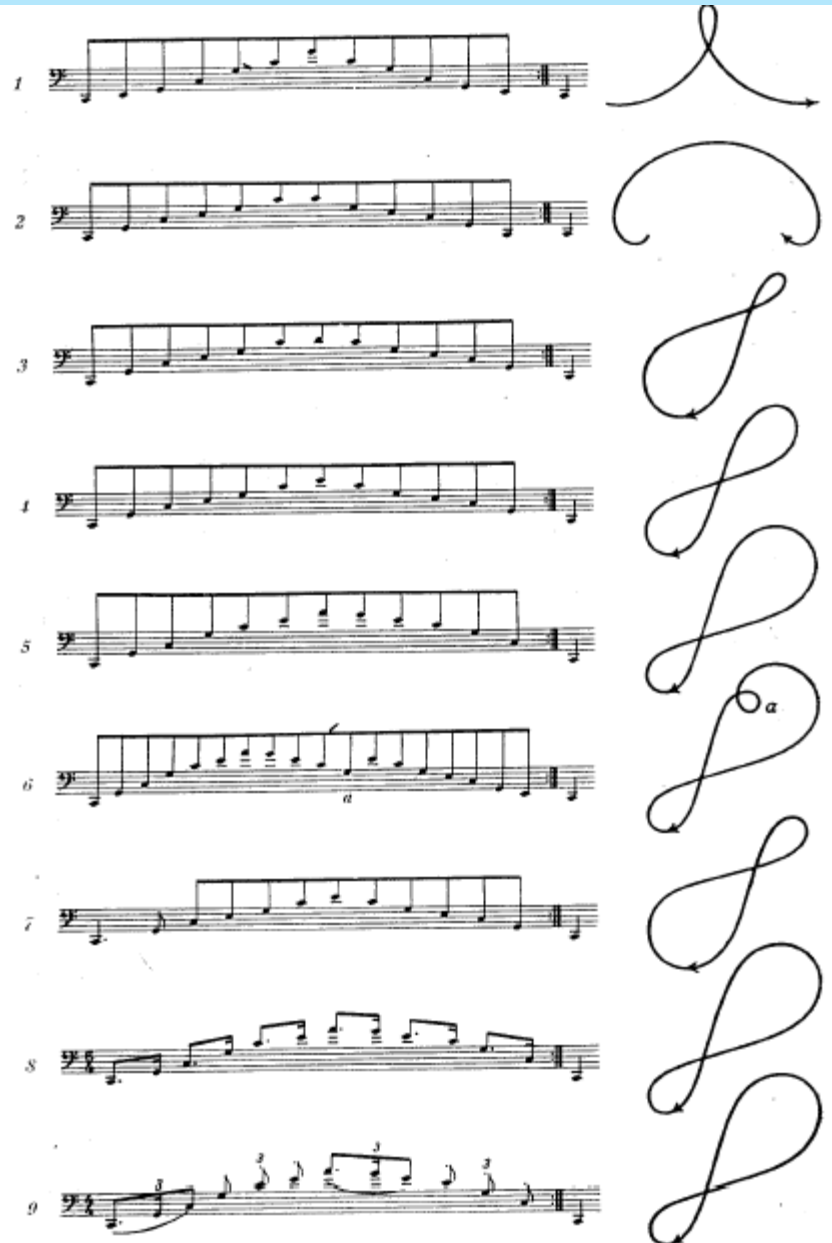

# Computational modelling of music cognition

- Information processing psychology (1960ies, Shannon, Wiener)
- Formal linguistics (Chomsky)
- Semiotics (Posner, Faltin Reinecke)
- Cognitive science – based on Gestalt theory
  - focus on structural aspects of music
  - mental processing connects sound and sense
- Symbol-based (Laske, 1975, Baroni, 1984, Balaban, 1992)
- Subsymbol-based (Todd and Loy, 1991, Leman, 1995)

- Problems with the cognitive approach:
  - Neglection of subjective component - Postmodern thinking:  
« new musicology » (Lidov, Cumming, Hatten)
  - No solution to the sound/sense problem.
    - Gestalt theory focuses on structure.
    - Mental activity cannot account for intentionality
  - Maturana and Varela:
    - Cognition is the result of action
    - Body (not mind) connects sound to sense
    - Body (not mind) can be extended with technology
    - body and technology mediate between sound and sense

- Rediscovery of early motion research in the 1990ies:
  - Aristotle: music as imitation of « men in action »
  - Lipps (1903): aesthetic experience is imitation
  - Truslit (1938)→ Repp (1993)
  - Becking (1928)→ Nettheim (1996)
  - Mauss (1934)
  - Laban (1940ies)

## 4. The active music listener

Truslit, A. (1938). *Gestaltung und Bewegung in der Musik*. Berlin-Lichterfelde: Chr. Friedrich Vieweg.

# Historische Tabelle der Schlagfiguren.

(Die Kurven können nur andeutungsweise, die Anweisungen nur unvollständig gegeben werden.)

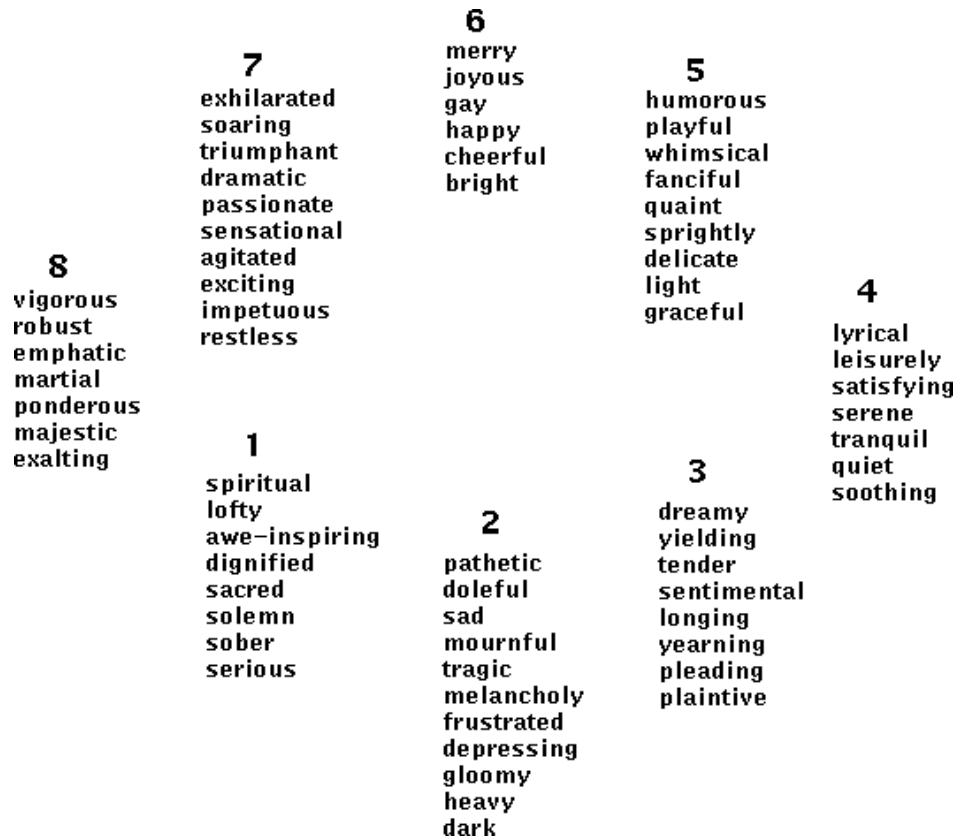

Typus	Der vorclassische Rhythmus in Deutschland					Der klassische Rhythmus in Deutschland						
	Barock (kursorisch)		Aufklärung			Klassik			Romantik			Wagner
	Generation von 1580	Generation von 1680	Rokoko	Rationalismus	Sturm und Drang	1. Klassiker	2. Klassiker	3. Klassiker	1. Generation	2. Generation	3. Generation	
I		 Arm! Die Abstriche barock aus- höhrend <b>Händel</b>				 Herrhaft abwärts <b>Haydn</b>	 Selbstver- ständlich ab- wärts. Sorg- fältig getönt <b>Mozart</b>			 Führen und Schwingen <b>Schubert</b>		
II	 Schulter! starr <b>Schütz</b>	 Arm! Gebunden schwingend <b>Telemann</b>	 Hand! Frei schaukelnd <b>Hasse</b>	 Ohne Schnörkel. Schlicht <b>Ph.E. Bach</b>				 Tief abwärts zwingen <b>Beethoven</b>	 Herziehen und Wegschieben <b>Hoffmann</b>	 Links und rechts ausschwingen <b>Weber</b>	 Herziehen und Wegschieben <b>Schumann</b>	
III	 Schulter! starr <b>M. Franck</b>	 Arm! Die Abstriche barock aus- höhrend <b>J. Seb. Bach</b>		 Nicht aus- höhrend. Spröde <b>Gluck</b>	 Ex- plosionen <b>Stamitz</b>						 Überfein <b>Mendelssohn</b>	 Flackeriger Druck <b>Wagner</b>

Becking

## From disembodied (Gestalt) cognition to embodied cognition

- Hevner (1936), Watson (1942), Reinecke (1964), Imberty (1976), Wedin (1972), ...
- Berlyne (1971) – relationship between subjective experience and objective descriptions of music
- Clynes (1977) – relationship between motion and emotion (santics)

25/07/2005

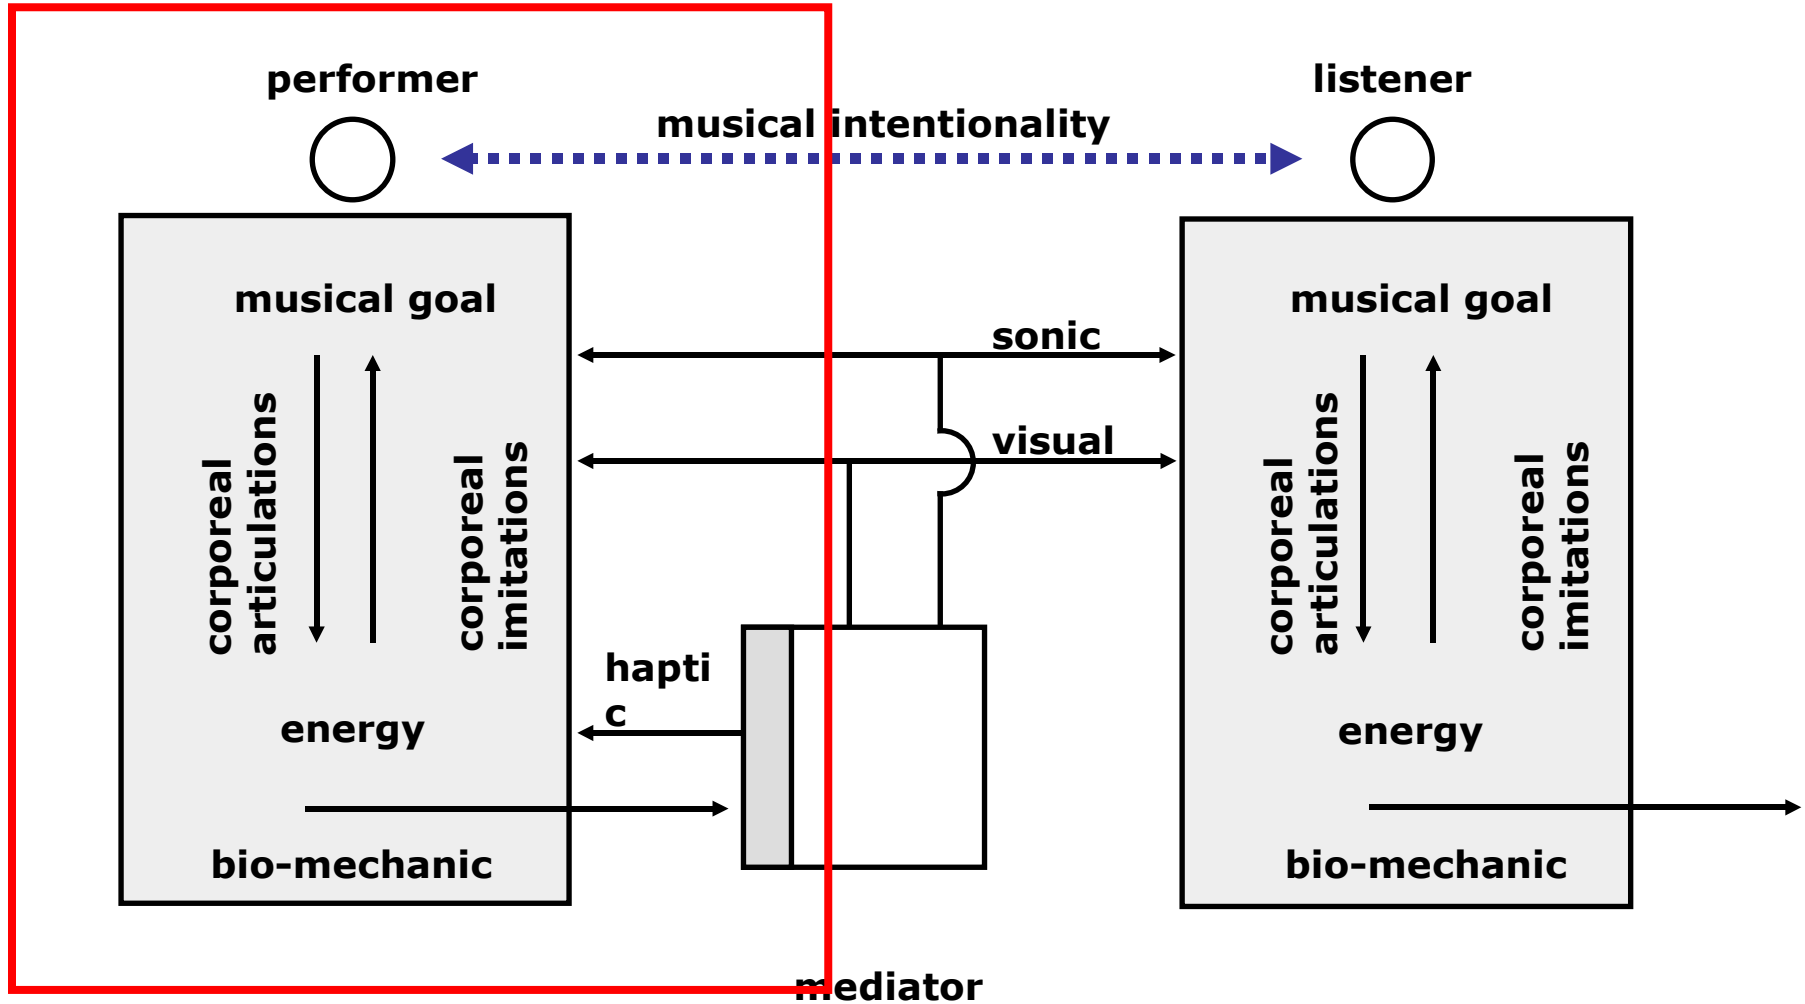

- Coupling perception and action (= sensorimotor coupling at the intentional level)
- Expressiveness in musical performance
- Modelling:
  - Physical modelling
  - Motor theory of perception (Lieberman & Mattingly, 1989, Lotto & Purves, 2003)

## PART 2: Proposal

Theory of music communication should be able to explain:

1. transition from sound to sense, and back
2. musical intentions (goal-directed action)
3. communication of musical expression...

# Musical Communication

## Production:

- Corporeal articulations realize mental representation as bio-mechanical energy

## Mediation:

- Bio-mechanical energy is translated into sound energy and partly reflected as haptic energy

## Perception:

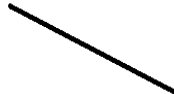

- Corporeal imitations give sense to sound energy

→ Human body is natural mediator between mind and matter, mediation technology is partly an extension of the human body

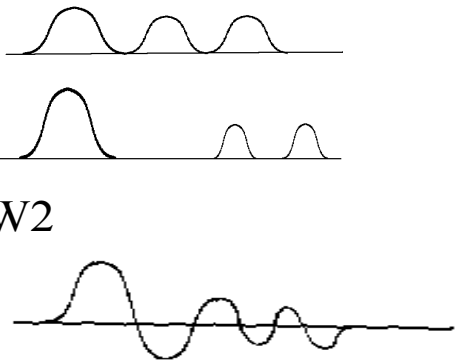

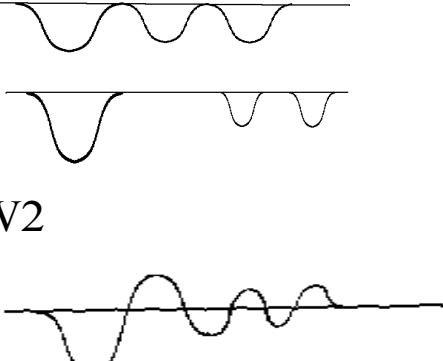

(Henbing Li)

# Basic playing forms

# Graphical attuning

# Conclusion

- Human body accounts for the transition between musical sound and sense → Human body is natural mediator → Technology can extend this natural mediator
- Sense has been studied from 2 perspectives:
  - Cognition: focus on feature extraction and classification, structural information, and mental processing
  - Beyond cognition: focus on body and technology mediation (cognition is an aspect of this), subjective information (emotion/affect/expression)
- Future: research on the mediation aspect

# Conclusion

- Focus on mind rather than body might have been a mistake
- Reason for the mistake: body gives the illusion of non-mediation
- If technology is an extension of our body, then technology should « disappear » as mediator, create this illusion of non-mediation
